## Exercise 4.1

### Question 11:

Prove the following by using the principle of mathematical induction for all  $n \in \mathbb{N}$ :

$$\frac{1}{1 \cdot 2 \cdot 3} + \frac{1}{2 \cdot 3 \cdot 4} + \frac{1}{3 \cdot 4 \cdot 5} + \dots + \frac{1}{n(n+1)(n+2)} = \frac{n(n+3)}{4(n+1)(n+2)}$$

### Answer 11:

Let the given statement be  $P(n)$ , i.e.,

$$P(n): \frac{1}{1 \cdot 2 \cdot 3} + \frac{1}{2 \cdot 3 \cdot 4} + \frac{1}{3 \cdot 4 \cdot 5} + \dots + \frac{1}{n(n+1)(n+2)} = \frac{n(n+3)}{4(n+1)(n+2)}$$

For  $n = 1$ , we have

$$P(1): \frac{1}{1 \cdot 2 \cdot 3} = \frac{1 \cdot (1+3)}{4(1+1)(1+2)} = \frac{1 \cdot 4}{4 \cdot 2 \cdot 3} = \frac{1}{1 \cdot 2 \cdot 3}, \text{ which is true.}$$

Let  $P(k)$  be true for some positive integer  $k$ , i.e.,

$$\frac{1}{1 \cdot 2 \cdot 3} + \frac{1}{2 \cdot 3 \cdot 4} + \frac{1}{3 \cdot 4 \cdot 5} + \dots + \frac{1}{k(k+1)(k+2)} = \frac{k(k+3)}{4(k+1)(k+2)} \quad \dots \text{ (i)}$$

We shall now prove that  $P(k + 1)$  is true.

Thus,  $P(k + 1)$  is true whenever  $P(k)$  is true.

Hence, by the principle of mathematical induction, statement  $P(n)$  is true for all natural numbers i.e.,  $\mathbb{N}$ .

## Question 12:

Prove the following by using the principle of mathematical induction for all  $n \in \mathbb{N}$ :

$$a + ar + ar^2 + \dots + ar^{n-1} = \frac{a(r^n - 1)}{r - 1}$$

## Answer 12:

Let the given statement be  $P(n)$ , i.e.,

$$P(n): a + ar + ar^2 + \dots + ar^{n-1} = \frac{a(r^n - 1)}{r - 1}$$

For  $n = 1$ , we have

$$P(1): a = \frac{a(r^1 - 1)}{(r - 1)} = a, \text{ which is true.}$$

Let  $P(k)$  be true for some positive integer  $k$ , i.e.,

$$a + ar + ar^2 + \dots + ar^{k-1} = \frac{a(r^k - 1)}{r - 1} \quad \dots \text{ (i)}$$

We shall now prove that  $P(k + 1)$  is true.

Consider

$$\begin{aligned} & \{a + ar + ar^2 + \dots + ar^{k-1}\} + ar^{(k+1)-1} \\ &= \frac{a(r^k - 1)}{r - 1} + ar^k \quad \quad \quad [\text{Using (i)}] \\ &= \frac{a(r^k - 1) + ar^k(r - 1)}{r - 1} \\ &= \frac{a(r^k - 1) + ar^{k+1} - ar^k}{r - 1} \\ &= \frac{ar^k - a + ar^{k+1} - ar^k}{r - 1} \\ &= \frac{ar^{k+1} - a}{r - 1} \\ &= \frac{a(r^{k+1} - 1)}{r - 1} \end{aligned}$$

Thus,  $P(k + 1)$  is true whenever  $P(k)$  is true.

Hence, by the principle of mathematical induction, statement  $P(n)$  is true for all natural numbers i.e.,  $N$ .

### Question 13:

Prove the following by using the principle of mathematical induction for all  $n \in N$ :

$$\left(1 + \frac{3}{1}\right)\left(1 + \frac{5}{4}\right)\left(1 + \frac{7}{9}\right) \dots \left(1 + \frac{(2n+1)}{n^2}\right) = (n+1)^2$$

### Answer 13:

Let the given statement be  $P(n)$ , i.e.,

# Mathematics

([www.tiwariacademy.com](http://www.tiwariacademy.com) : A step towards free education)

(Chapter – 4) (Principle of Mathematical Induction)

$$P(n) : \left(1 + \frac{3}{1}\right) \left(1 + \frac{5}{4}\right) \left(1 + \frac{7}{9}\right) \dots \left(1 + \frac{(2n+1)}{n^2}\right) = (n+1)^2$$

For  $n = 1$ , we have

$$P(1) : \left(1 + \frac{3}{1}\right) = 4 = (1+1)^2 = 2^2 = 4, \text{ which is true.}$$

Let  $P(k)$  be true for some positive integer  $k$ , i.e.,

$$\left(1 + \frac{3}{1}\right) \left(1 + \frac{5}{4}\right) \left(1 + \frac{7}{9}\right) \dots \left(1 + \frac{(2k+1)}{k^2}\right) = (k+1)^2 \quad \dots (1)$$

We shall now prove that  $P(k + 1)$  is true.

Consider

$$\begin{aligned} & \left[ \left(1 + \frac{3}{1}\right) \left(1 + \frac{5}{4}\right) \left(1 + \frac{7}{9}\right) \dots \left(1 + \frac{(2k+1)}{k^2}\right) \right] \left[ 1 + \frac{\{2(k+1)+1\}}{(k+1)^2} \right] \\ &= (k+1)^2 \left[ 1 + \frac{2(k+1)+1}{(k+1)^2} \right] \quad [\text{Using (1)}] \\ &= (k+1)^2 \left[ \frac{(k+1)^2 + 2(k+1)+1}{(k+1)^2} \right] \\ &= (k+1)^2 + 2(k+1)+1 \\ &= \{(k+1)+1\}^2 \end{aligned}$$

Thus,  $P(k + 1)$  is true whenever  $P(k)$  is true.

Hence, by the principle of mathematical induction, statement  $P(n)$  is true for all natural numbers i.e.,  $\mathbb{N}$ .

Prove the following by using the principle of mathematical induction for all  $n \in \mathbb{N}$ :

$$\left(1 + \frac{1}{1}\right)\left(1 + \frac{1}{2}\right)\left(1 + \frac{1}{3}\right)\dots\left(1 + \frac{1}{n}\right) = (n+1)$$

## Answer 14:

Let the given statement be  $P(n)$ , i.e.,

$$P(n) : \left(1 + \frac{1}{1}\right)\left(1 + \frac{1}{2}\right)\left(1 + \frac{1}{3}\right)\dots\left(1 + \frac{1}{n}\right) = (n+1)$$

For  $n = 1$ , we have

$$P(1) : \left(1 + \frac{1}{1}\right) = 2 = (1+1) \text{ , which is true.}$$

Let  $P(k)$  be true for some positive integer  $k$ , i.e.,

$$P(k) : \left(1 + \frac{1}{1}\right)\left(1 + \frac{1}{2}\right)\left(1 + \frac{1}{3}\right)\dots\left(1 + \frac{1}{k}\right) = (k+1) \quad \dots (1)$$

We shall now prove that  $P(k + 1)$  is true.

Let  $P(k)$  be true for some positive integer  $k$ , i.e.,

$$P(k) = 1^2 + 3^2 + 5^2 + \dots + (2k-1)^2 = \frac{k(2k-1)(2k+1)}{3} \quad \dots (1)$$

## Question 18:

Prove the following by using the principle of mathematical induction for all  $n \in \mathbb{N}$ :

$$1+2+3+\dots+n < \frac{1}{8}(2n+1)^2$$

## Answer 18:

Let the given statement be  $P(n)$ , i.e.,

$$P(n): 1+2+3+\dots+n < \frac{1}{8}(2n+1)^2$$

It can be noted that  $P(n)$  is true for  $n = 1$  since

$$1 < \frac{1}{8}(2 \cdot 1 + 1)^2 = \frac{9}{8}.$$

Let  $P(k)$  be true for some positive integer  $k$ , i.e.,

$$1+2+\dots+k < \frac{1}{8}(2k+1)^2 \quad \dots (1)$$

We shall now prove that  $P(k + 1)$  is true whenever  $P(k)$  is true.

Hence,  $(1+2+3+\dots+k)+(k+1) < \frac{1}{8}(2k+1)^2 + (k+1)$

Thus,  $P(k+1)$  is true whenever  $P(k)$  is true.

Hence, by the principle of mathematical induction, statement  $P(n)$  is true for all natural numbers i.e.,  $N$ .

## Question 19:

$n(n+1)(n+5)$  is a multiple of 3.

## Answer 19:

Let the given statement be  $P(n)$ , i.e.,

$P(n)$ :  $n(n+1)(n+5)$ , which is a multiple of 3.

It can be noted that  $P(n)$  is true for  $n = 1$  since  $1(1+1)(1+5) = 12$ , which is a multiple of 3.

$\therefore k(k+1)(k+5) = 3m$ , where  $m \in \mathbf{N} \dots (1)$

We shall now prove that  $P(k+1)$  is true whenever  $P(k)$  is true.

Consider

Thus,  $P(k+1)$  is true whenever  $P(k)$  is true.

Hence, by the principle of mathematical induction, statement  $P(n)$  is true for all natural numbers i.e.,  $N$ .

## Question 20:

Prove the following by using the principle of mathematical induction for all  $n \in \mathbf{N}$ :

$10^{2n-1} + 1$  is divisible by 11.

## Answer 20:

Let the given statement be  $P(n)$ , i.e.,

$P(n)$ :  $10^{2n-1} + 1$  is divisible by 11.

It can be observed that  $P(n)$  is true for  $n = 1$

since  $P(1) = 10^{2 \cdot 1 - 1} + 1 = 11$ , which is divisible by 11.

Let  $P(k)$  be true for some positive integer  $k$ ,

i.e.,  $10^{2k-1} + 1$  is divisible by 11.

$\therefore 10^{2k-1} + 1 = 11m$ , where  $m \in \mathbf{N}$  ... (1)

We shall now prove that  $P(k + 1)$  is true whenever  $P(k)$  is true.

Consider

# Mathematics

(Chapter – 4) (Principle of Mathematical Induction))

(Class – XI)

$$\begin{aligned} & 10^{2(k+1)-1} + 1 \\ &= 10^{2k+2-1} + 1 \\ &= 10^{2k+1} + 1 \\ &= 10^2 (10^{2k-1} + 1 - 1) + 1 \\ &= 10^2 (10^{2k-1} + 1) - 10^2 + 1 \\ &= 10^2 \cdot 11m - 100 + 1 \quad \quad \quad [\text{Using (1)}] \\ &= 100 \times 11m - 99 \\ &= 11(100m - 9) \\ &= 11r, \text{ where } r = (100m - 9) \text{ is some natural number} \end{aligned}$$

Therefore,  $10^{2(k+1)-1} + 1$  is divisible by 11.

Thus,  $P(k + 1)$  is true whenever  $P(k)$  is true.

Hence, by the principle of mathematical induction, statement  $P(n)$  is true for all natural numbers i.e.,  $N$ .
